

PATIENT: BLACKWELL, THEODORE R DOB: 09/14/1957 MRN: E4085221

EXAM DATE: 05/28/2026 RADIOLOGIST: Priya Natarajan, MD ORDERING: Marcus Oyelaran, MD

EXAM

CT abdomen and pelvis with IV contrast (reduced-dose contrast protocol given eGFR 48).

INDICATION

Stage III sigmoid colon adenocarcinoma on adjuvant chemotherapy; interval assessment.

TECHNIQUE

Helical CT of the abdomen and pelvis following administration of 75 mL Omnipaque 350. Oral contrast administered.

FINDINGS

Postsurgical changes of sigmoid colectomy with intact anastomosis; no anastomotic leak. No pericolic fluid collection or abscess. Liver: no focal hepatic lesion; hepatic steatosis. No new hepatic metastasis. Pancreas, spleen, adrenals unremarkable. Kidneys: bilateral cortical thinning consistent with chronic kidney disease; no hydronephrosis. No retroperitoneal or mesenteric lymphadenopathy by size criteria. Port-a-cath tip in the cavoatrial junction. Mild cardiomegaly. Trace bilateral pleural effusions at the imaged lung bases. No free air. Degenerative changes of the lumbar spine.

IMPRESSION

1. No evidence of local recurrence or metastatic disease.
2. Postsurgical changes of sigmoid colectomy, intact anastomosis.
3. Trace bilateral pleural effusions and mild cardiomegaly - correlate with volume status given known heart failure.
